Target platform

Percentages are calculated only from the 93 complete scans, excluding 1 partial scans, 0 failed scans, and 6 repositories with no eligible source. Each repository is counted in exactly one category, so shares add up to 100%.

One primary platform per repository: an explicit OS target wins, several OS targets = Multiple OS, otherwise the most specific environment; generic runtimes/scripts come last.

Project application and automation types

Share of complete repository scans with collected project findings, including libraries/tools and non-Windows PowerShell. Each repository counts once per category across its projects. Categories overlap: Windows desktop app includes Windows Forms, WPF, WinUI, and UWP; shares need not sum to 100%. Older inventories without project findings are excluded. Types are identified from source patterns and project metadata, not inferred from OS or language. Repositories without sufficient type evidence remain in the denominator and are reported in the classification coverage note, not as application types. Static indicators do not prove executable or runtime behavior.

Static, source-level evidence only; detection of a pattern is not proof of runtime use, and absence of a match is not proof of non-use. Partial and failed scans are nonresponse and are excluded from distributions, which can bias estimates if they differ systematically.
